# Lesson 02 Demo 05

# Setting up CloudWatch Metrics and Alarms for a CI/CD Pipeline

**Objective:** To automate the continuous integration process as part of DevOps by implementing CloudWatch metrics and alarms on CodePipeline

**Tools required:** AWS CloudWatch and AWS CodePipeline

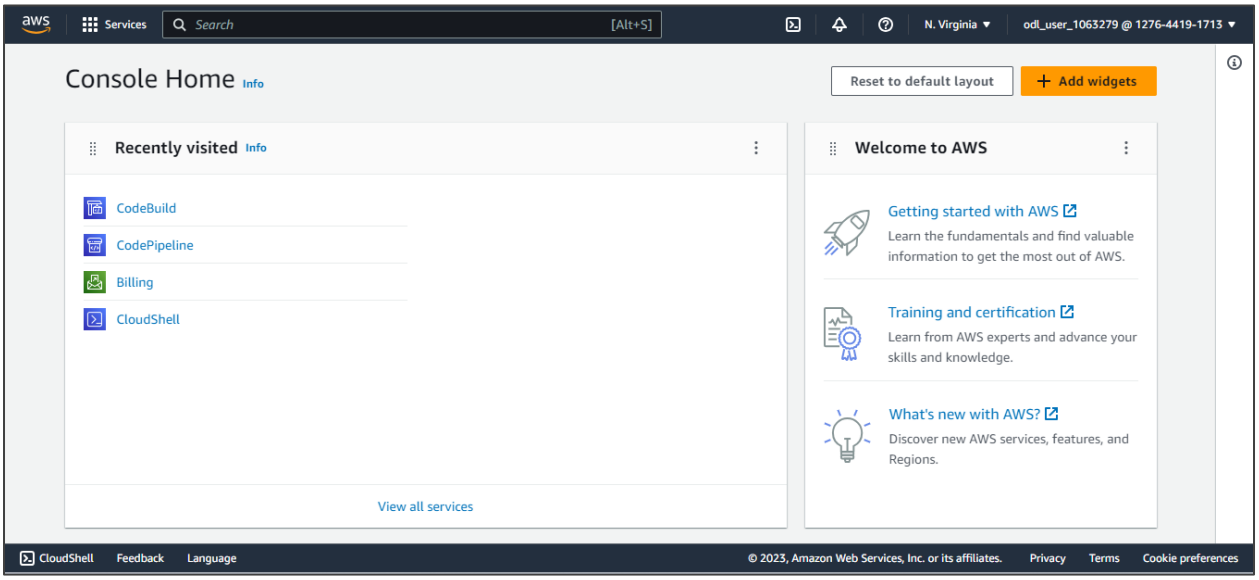
**Prerequisites:** None

Steps to be followed:

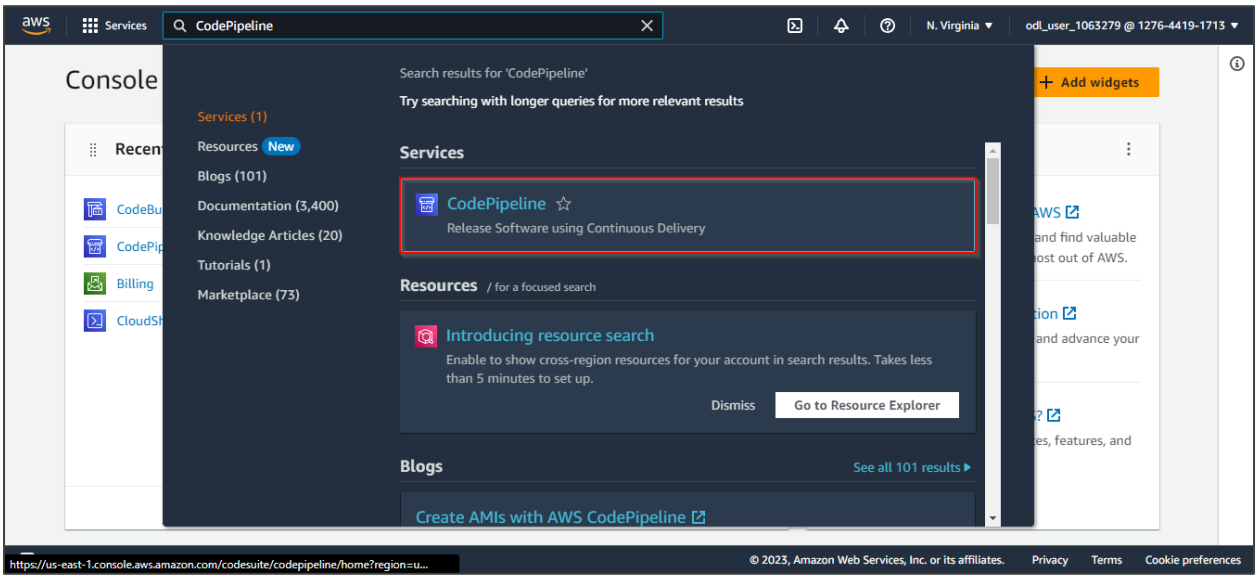
1. Configure CloudWatch metrics and alarms on CodePipeline

## Step 1: Configure CloudWatch metrics and alarms on CodePipeline

1.1 Sign in to the AWS Console

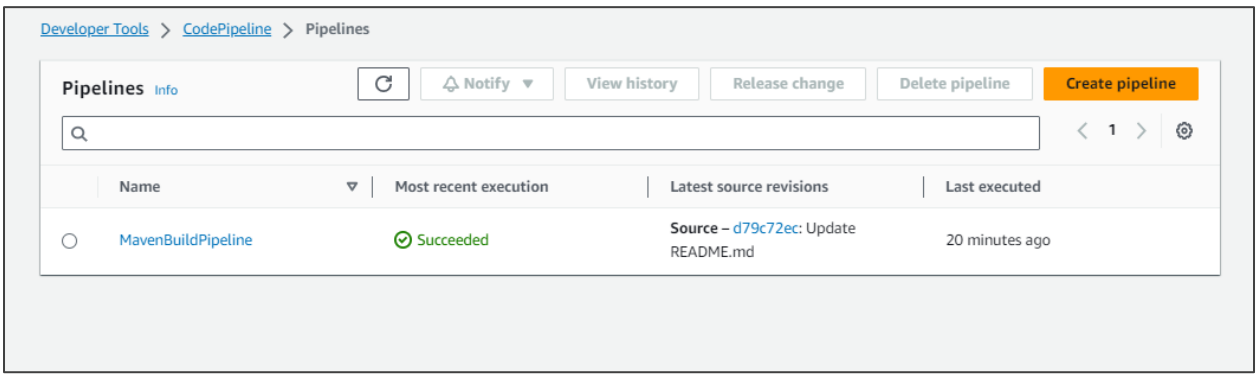


1.2 Search for and click on **CodePipeline**

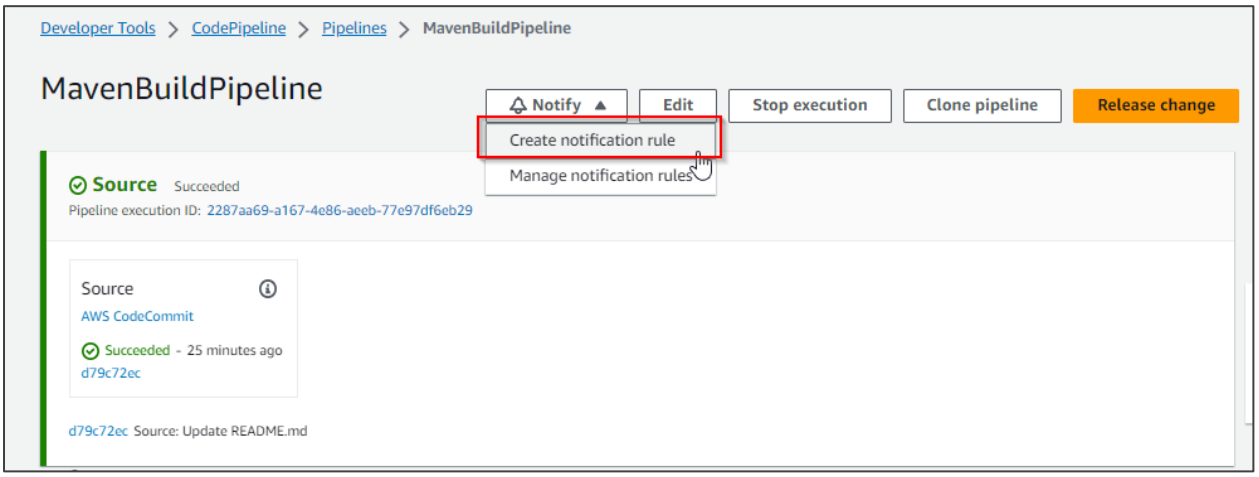


1.3 Click on the desired pipeline to configure CloudWatch

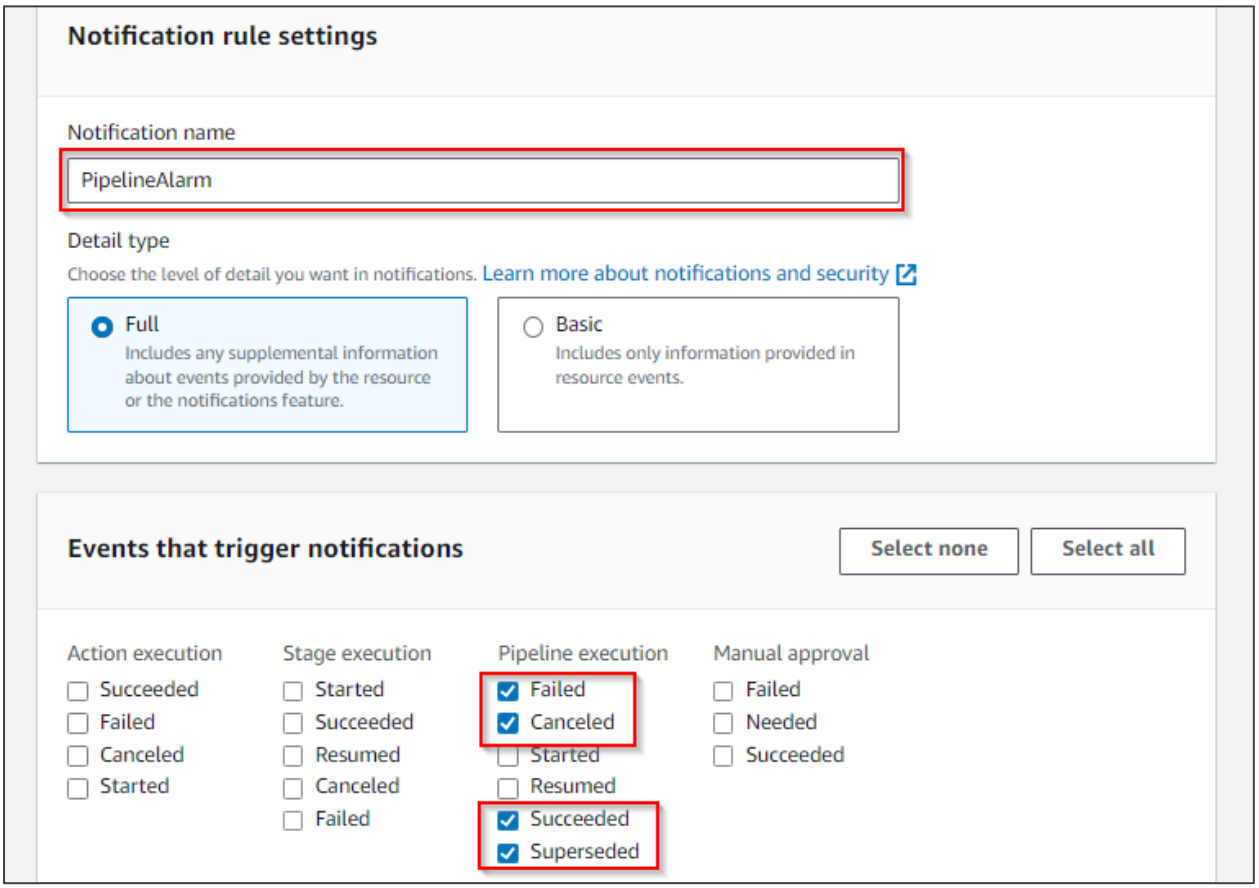
> **Note:** Refer to demo **06_Implementing_a_Blue_Green_Deployment_Using_CodeDeploy** from **Lesson 04** to create a pipeline using CodePipeline



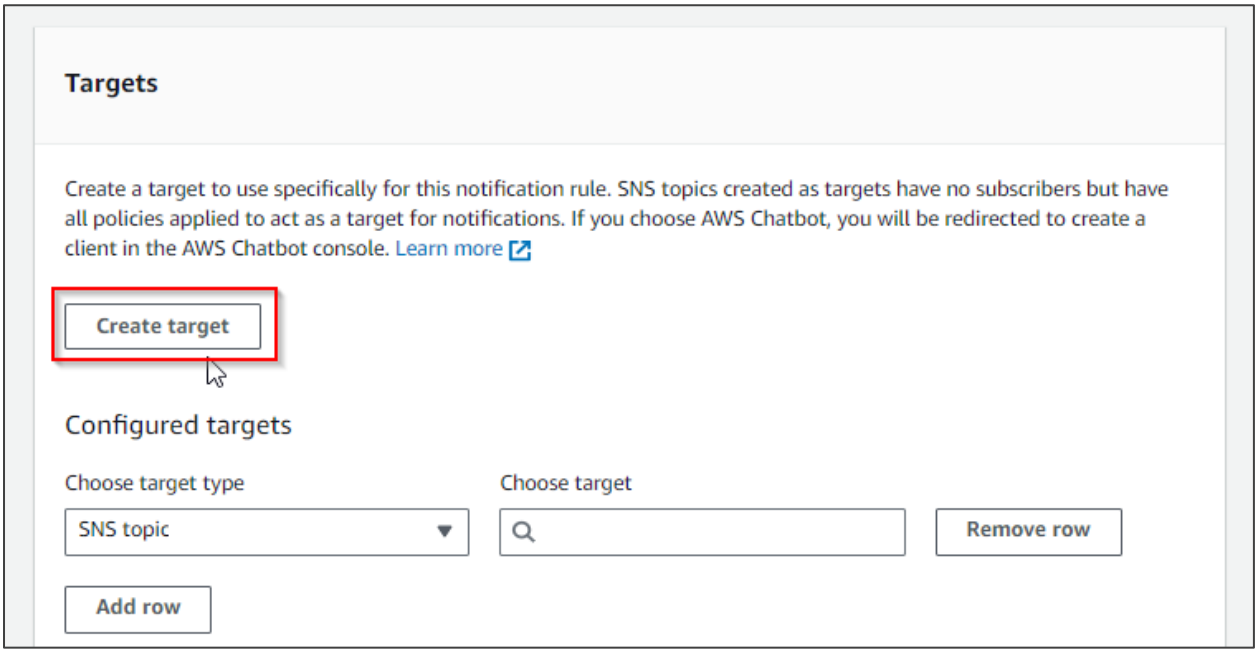
1.4 Click on the **Notify** button and then select **Create notification rule**



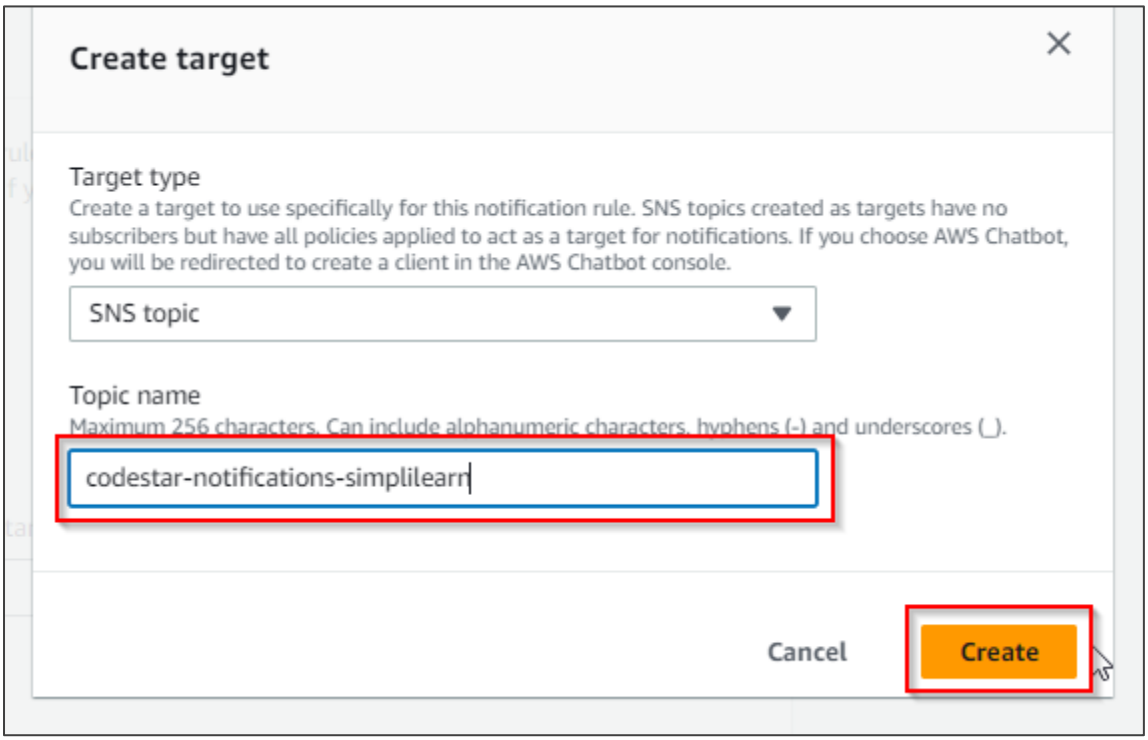
1.5 Select the desired events to invoke a notification for and add a name as shown below:



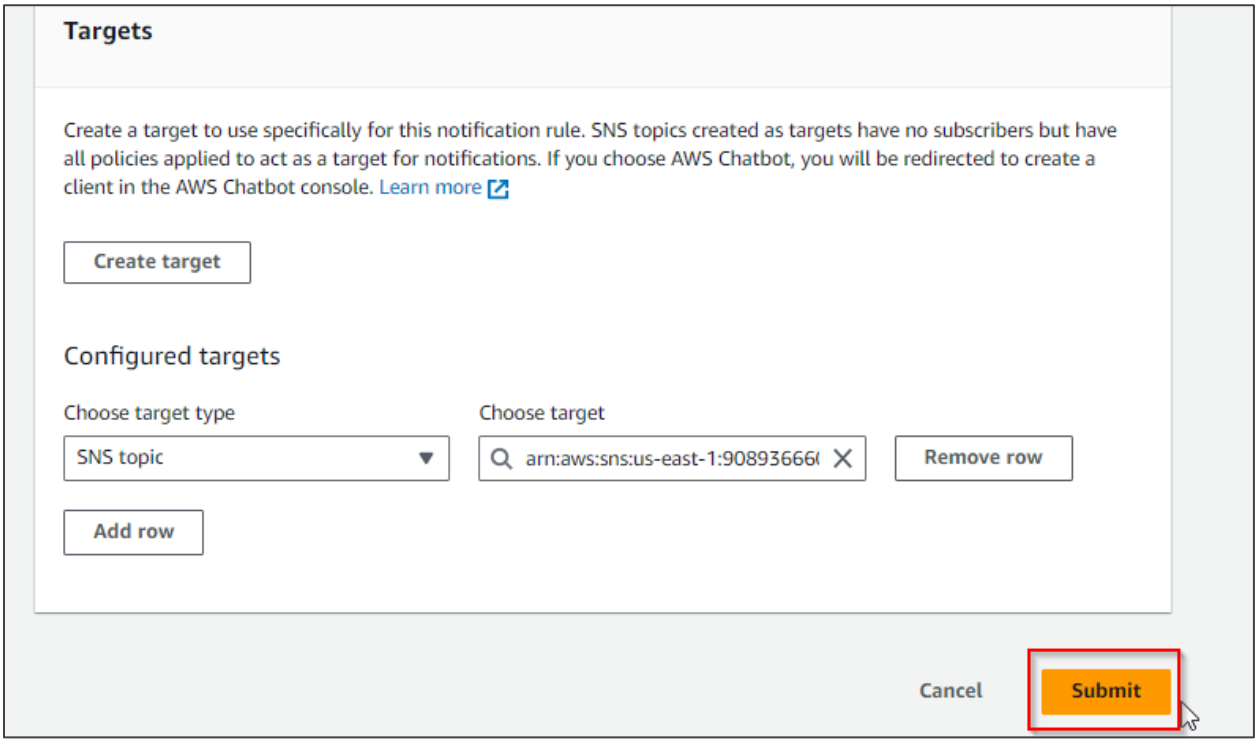
1.6 Click on the **Create target** button to configure the target which notifications will be sent to



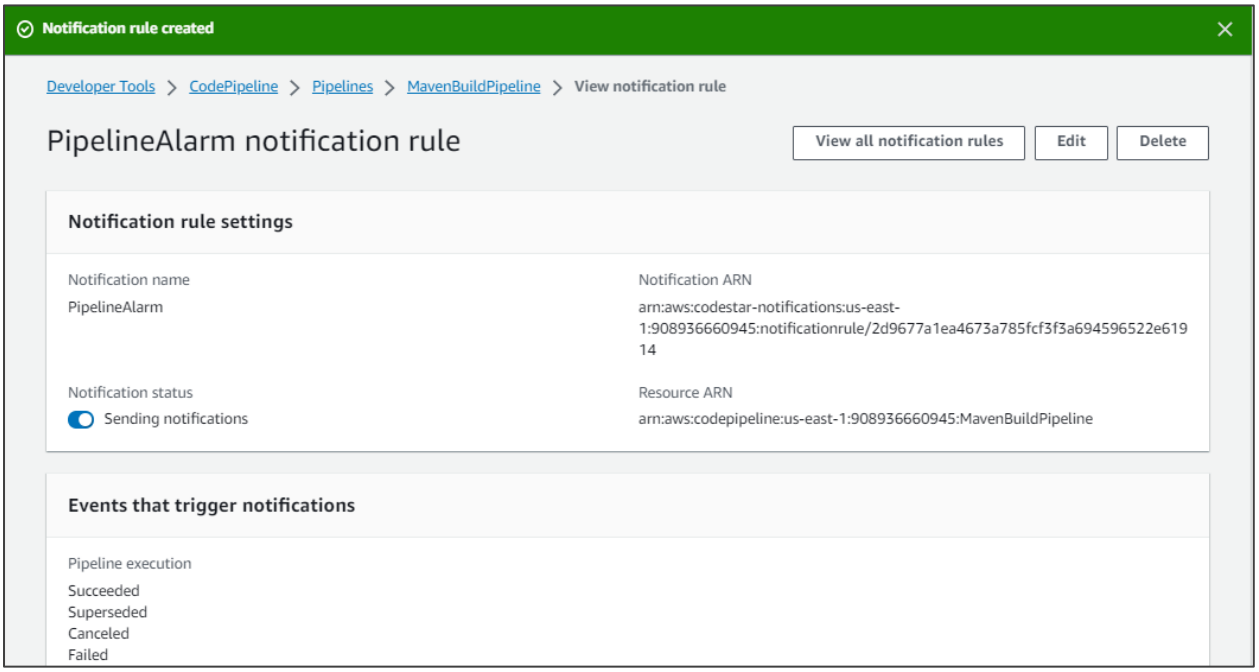
1.7 Add the **Topic name** and click on **Create**



1.8 Once the target is created successfully, click on **Submit** to complete the notification rule process

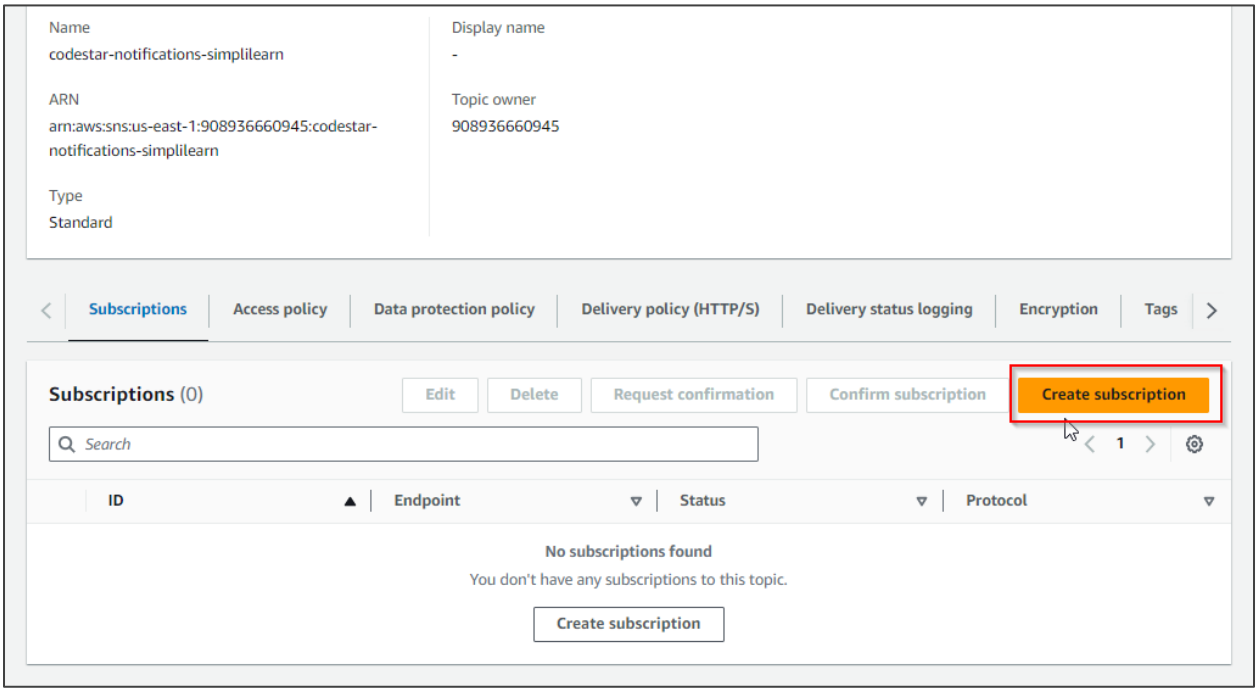


You will then see the following interface:

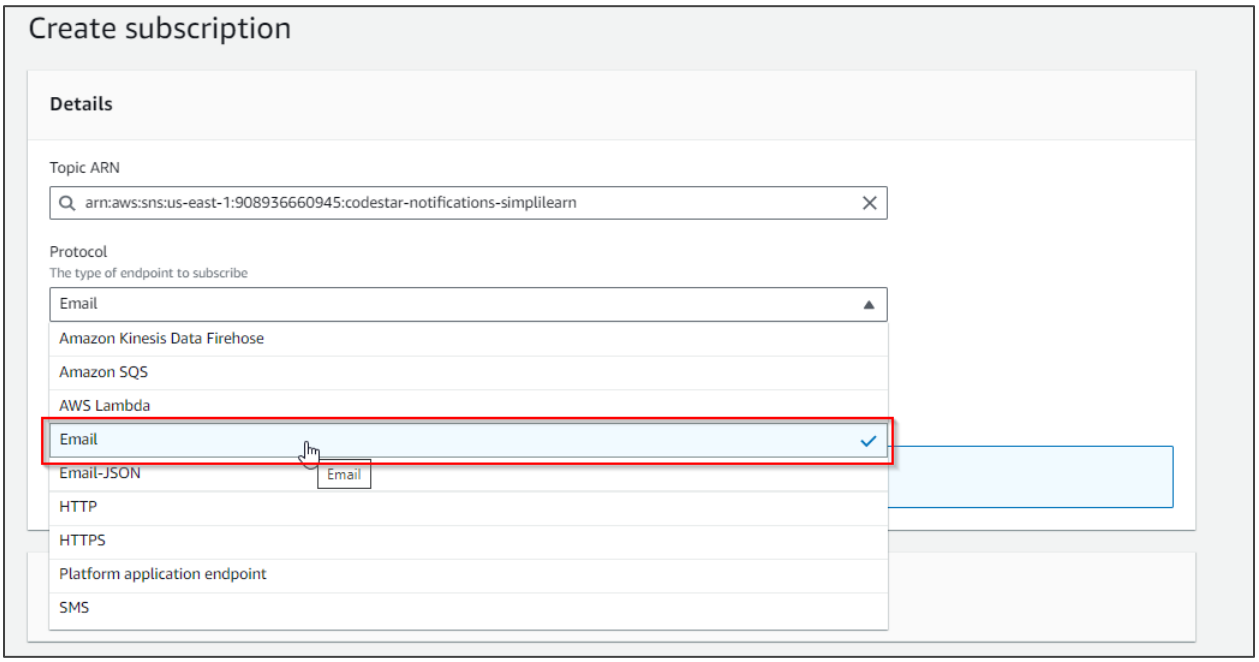


1.9 Click on the **Address or endpoint** link to create subscriptions to this SNS topic to specify who will receive the notifications

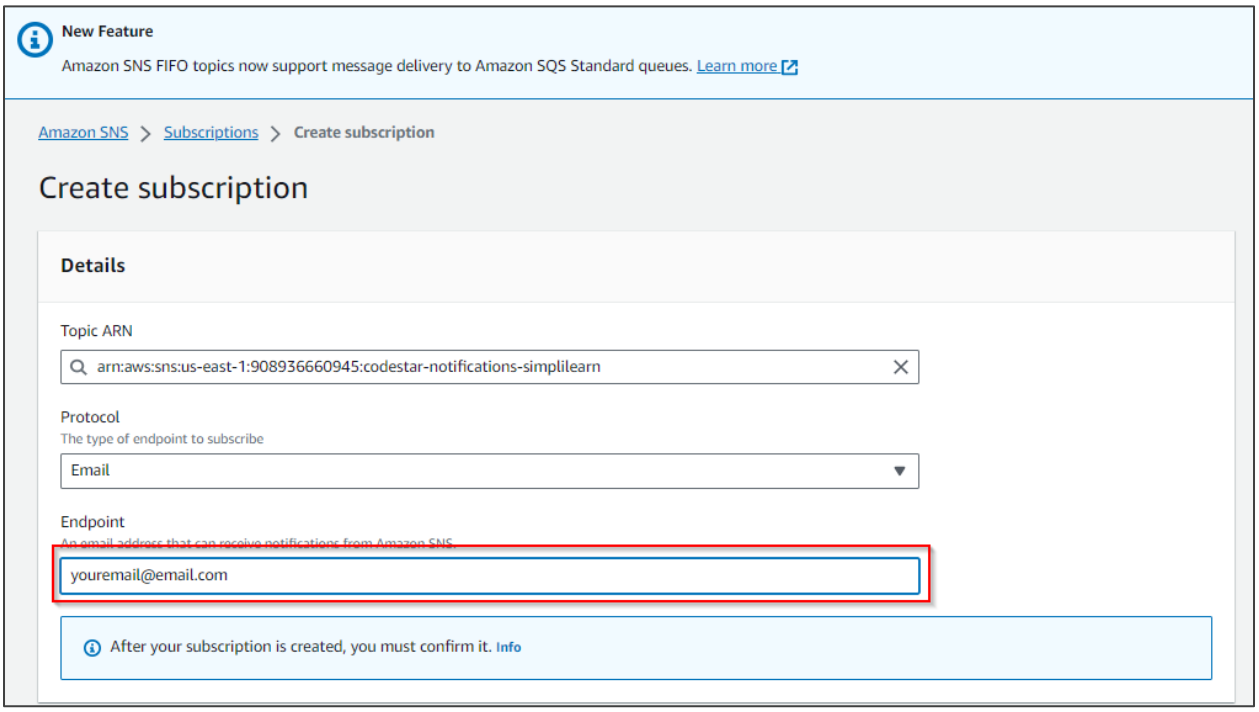
1.10 Click on the **Create subscription** button



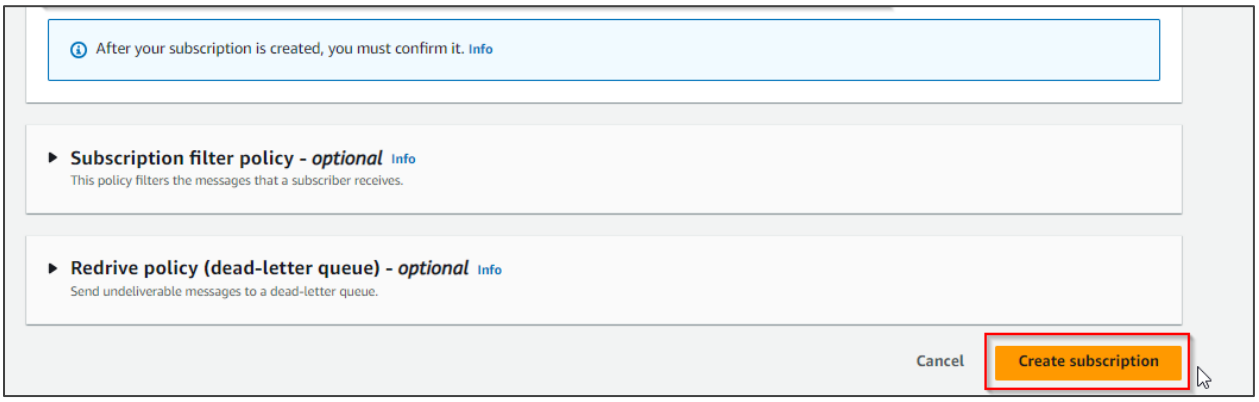
1.11 Select **Email** as an endpoint under **Protocol**



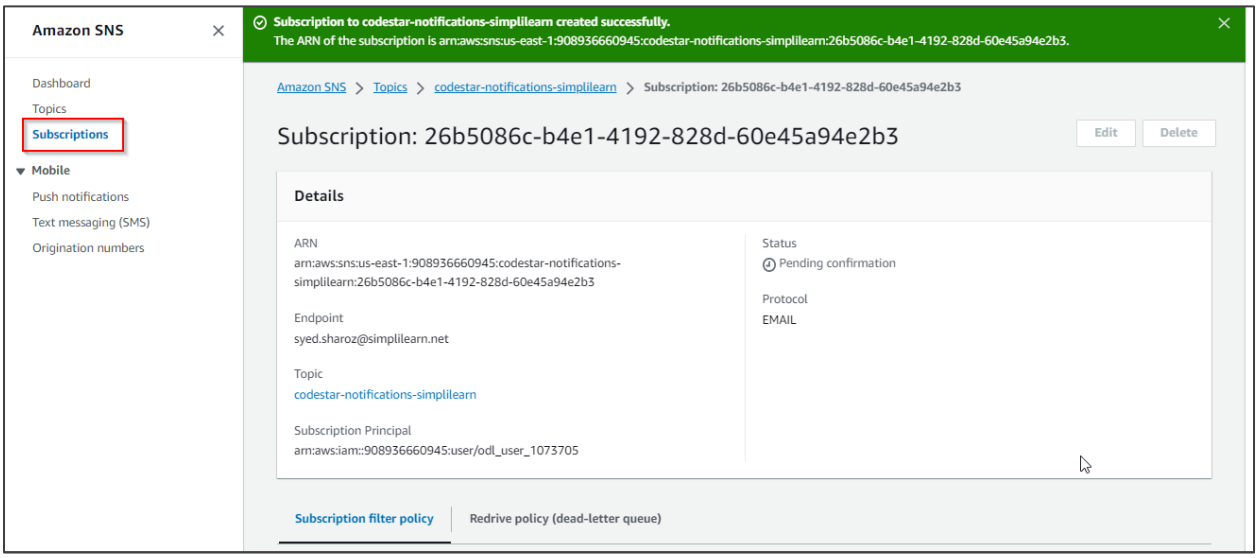
1.12 Enter the email address of the receiver



1.13 Click on **Create subscription**



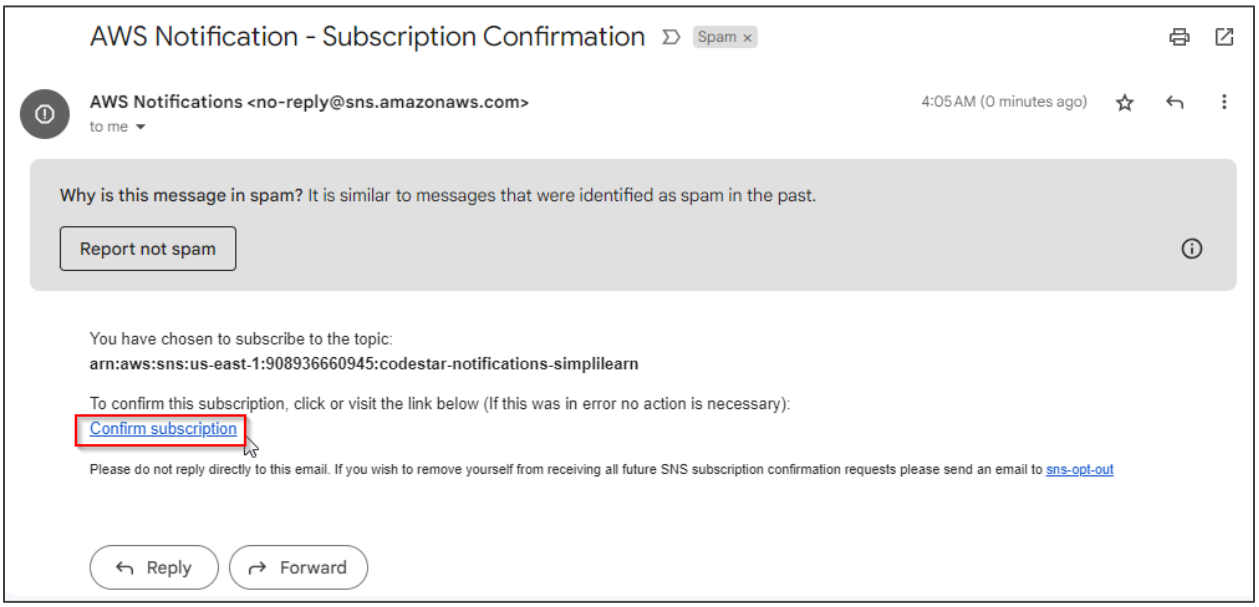
1.14 In the Amazon SNS list at the top left corner, click **Subscriptions**:



The details will then be displayed. You will see a **Pending confirmation** status for the endpoint that you provided.

1.15 Confirm the subscription by clicking on **Confirm subscription** from the confirmation email in your mailbox

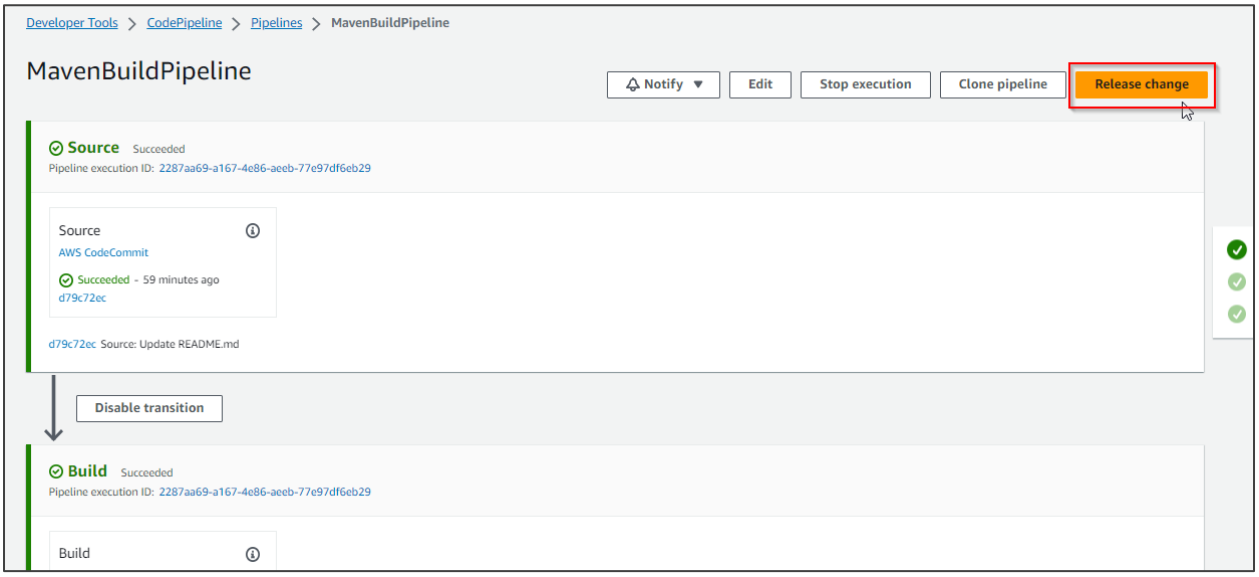
**Note**: If you do not receive a confirmation email in your inbox, check your spam or junk folder.



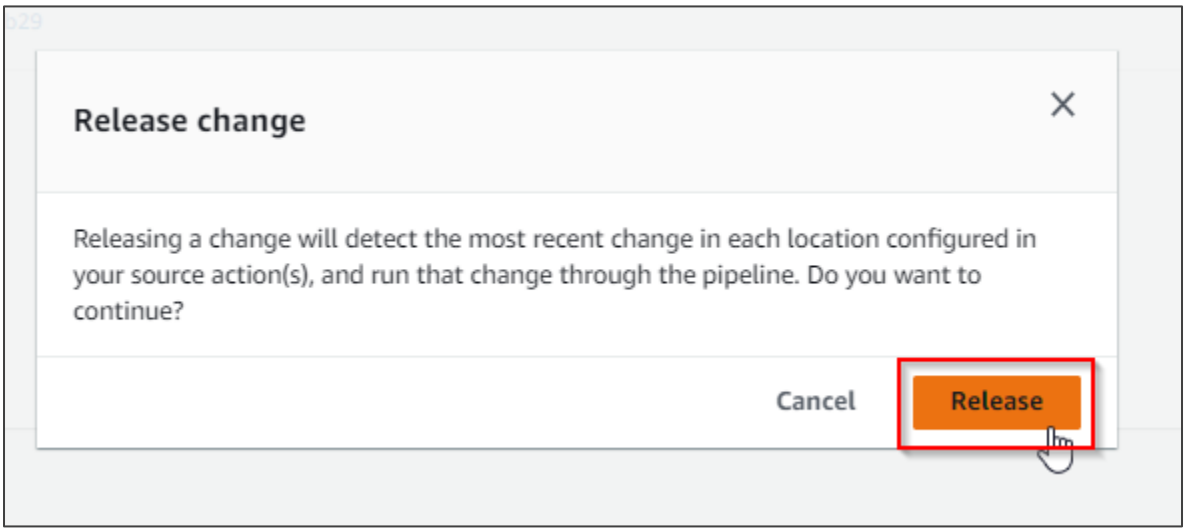
After confirming the subscription, you will see the following interface:

You can now test the notification rule by invoking the CodePipeline.

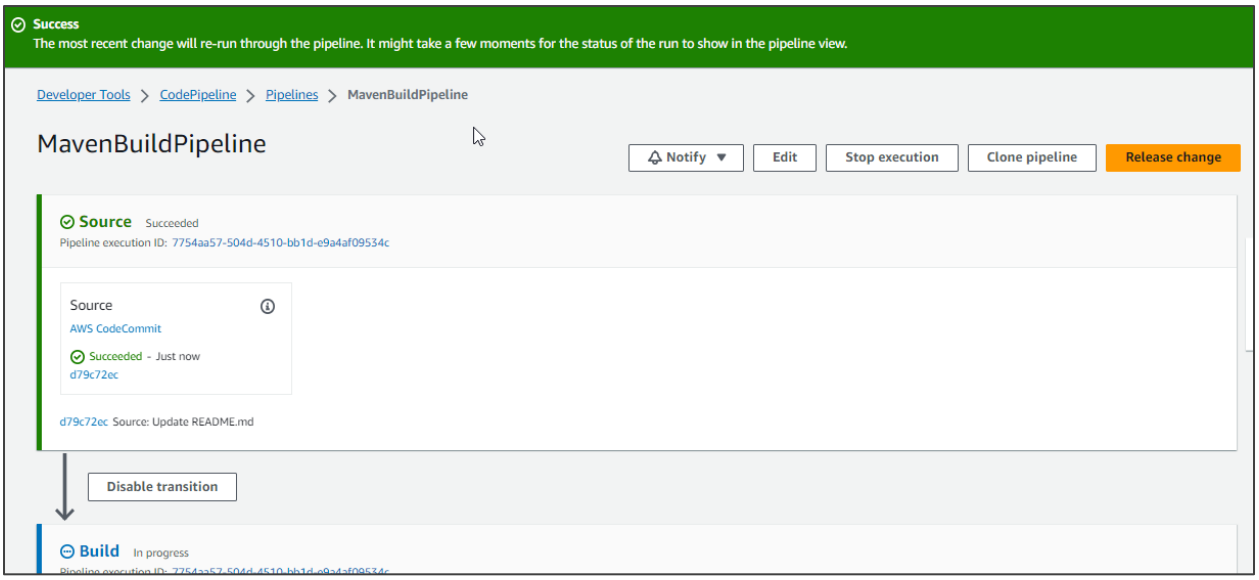
1.16 Navigate to the **CodePipeline** section, select the previously created pipeline, and click on **Release change**

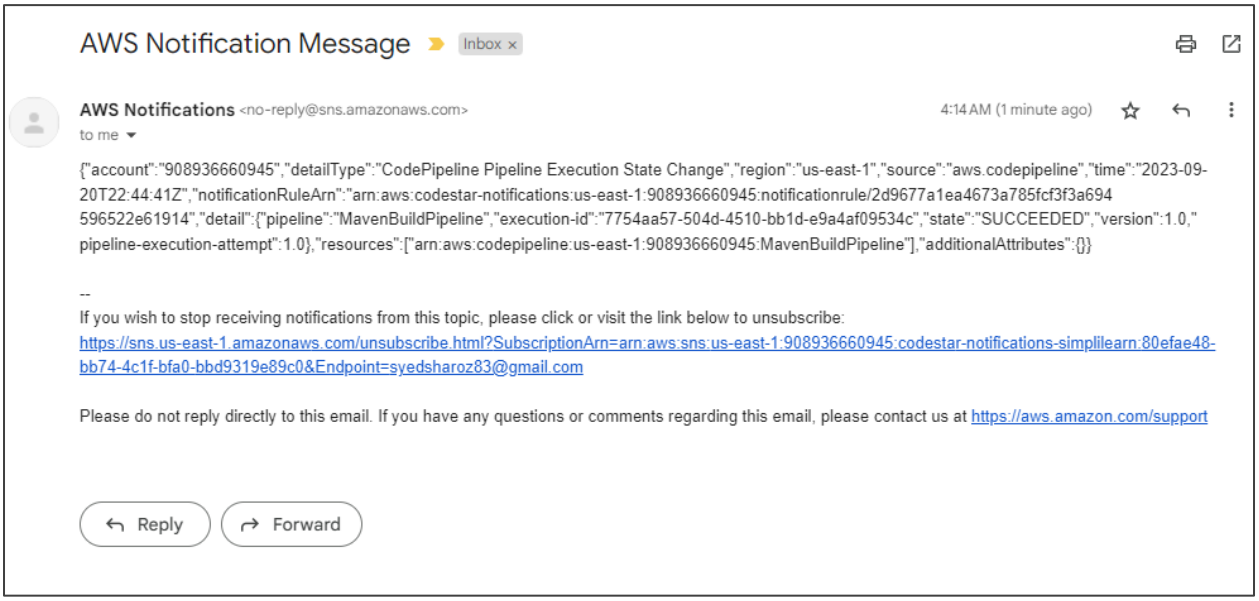


1.17 Click on **Release**



The changes made will be re-run through the pipeline. Then, you will receive an email regarding the status as shown in the screenshots:





By following these steps, you have successfully implemented CloudWatch metrics and alarms on AWS CodePipeline.
