Lesson 02 Demo 01

Creating a Pipeline from the GitHub Repository

Objective: To create an AWS CodePipeline for continuous integration and delivery (CI/CD) using a GitHub repository

Tools required: GitHub and CodePipeline

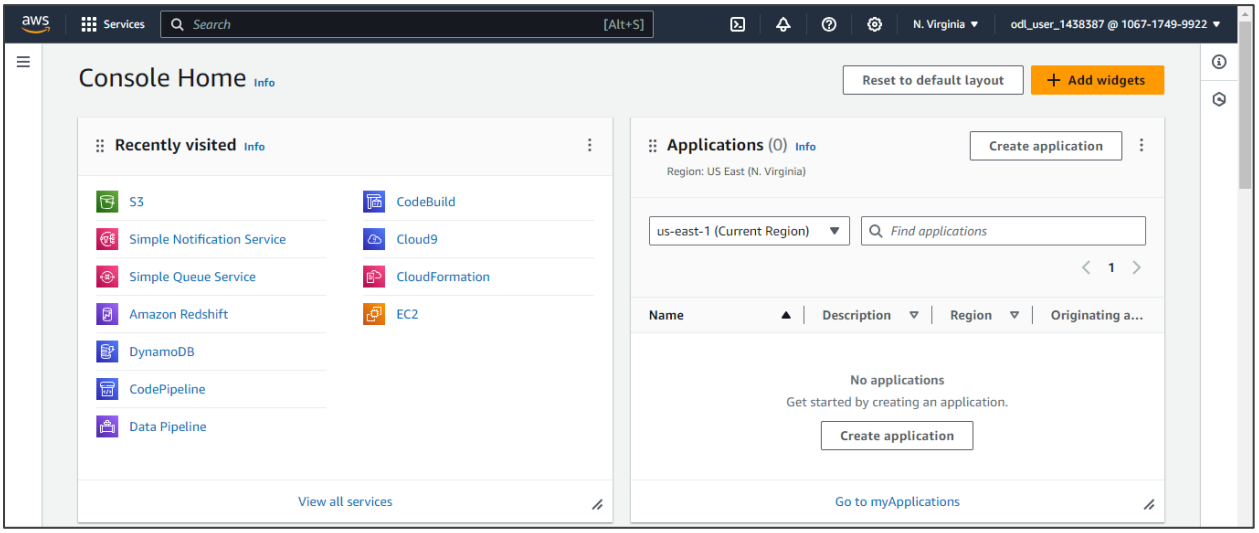
Prerequisites: A GitHub Git repository with the master branch should be set up and integrated with AWS CodePipeline for continuous integration and delivery (CI/CD)

Steps to be followed:

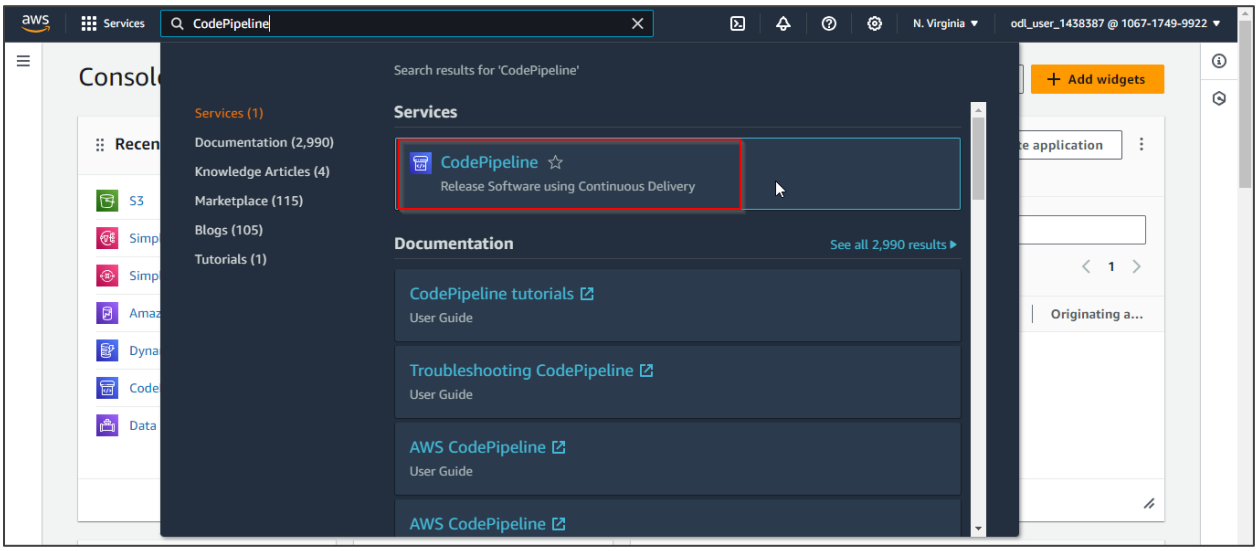
1. Create a new pipeline using the GitHub repository

Step 1: Create a new pipeline using the GitHub repository

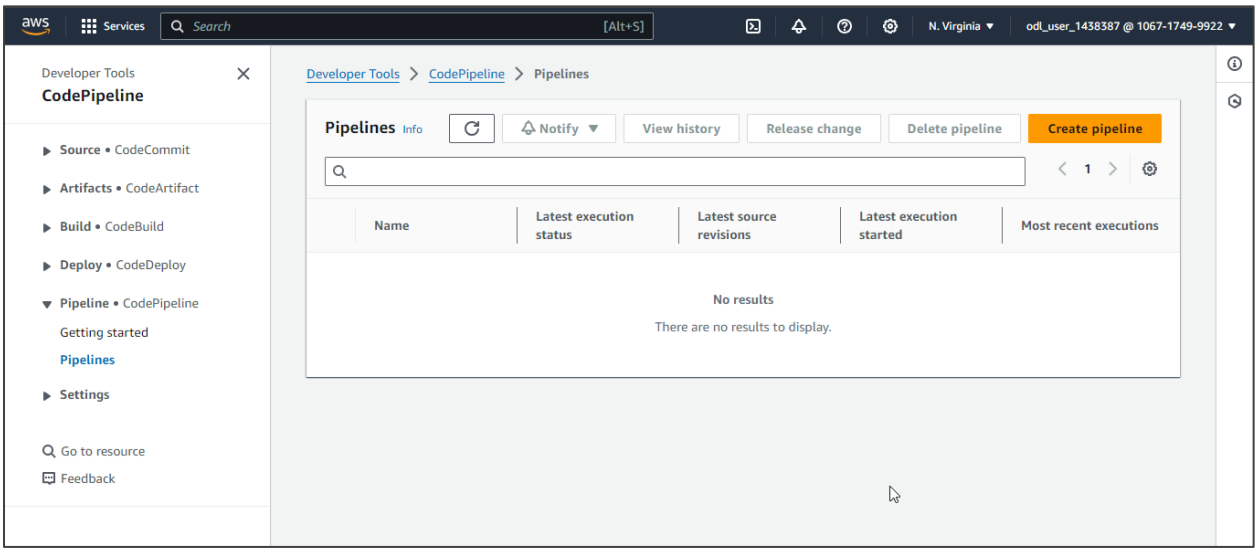
1.1 Sign in to the AWS Console



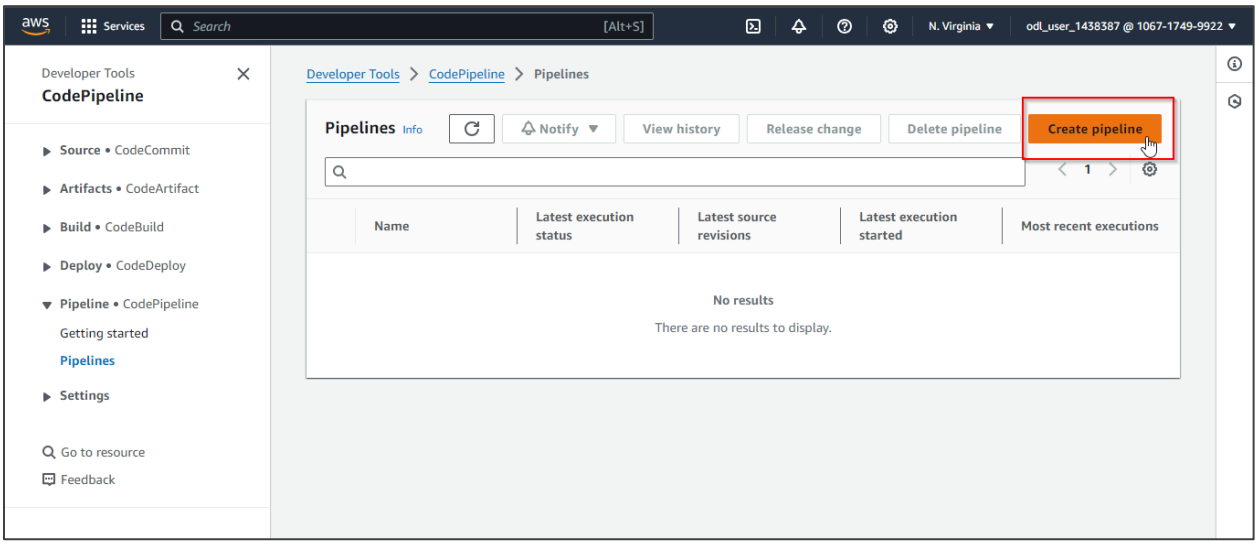
1.2 Search for and click on **CodePipeline**



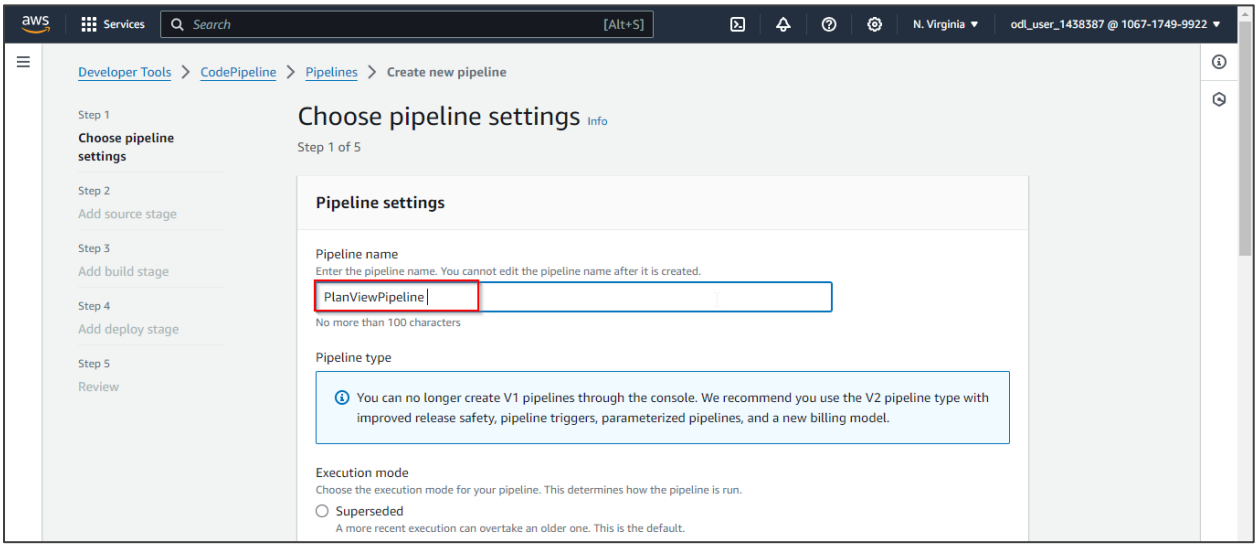
After clicking on the **CodePipeline** service, you will see the following interface:

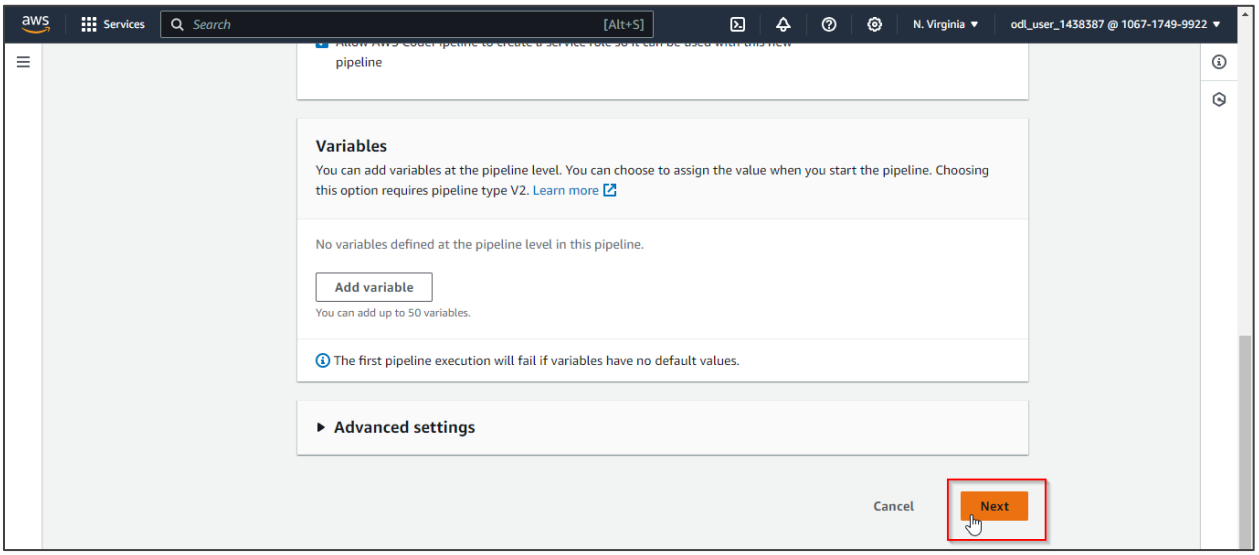


1.3 Click on the **Create pipeline** button

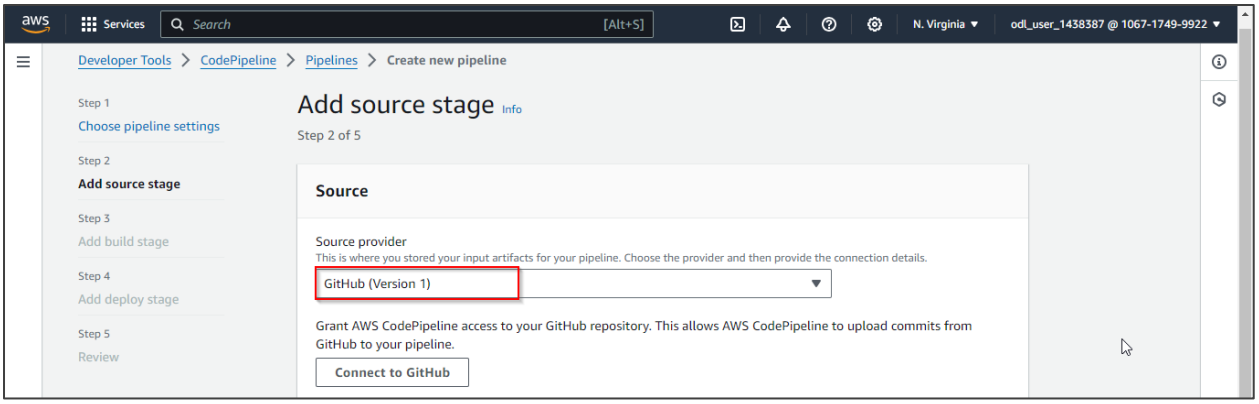


1.4 Enter a name for the pipeline and click the **Next** button

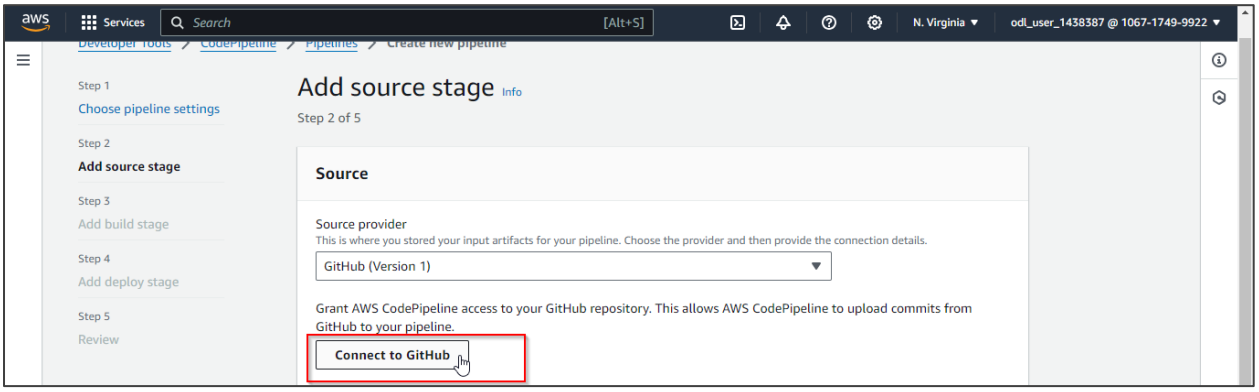




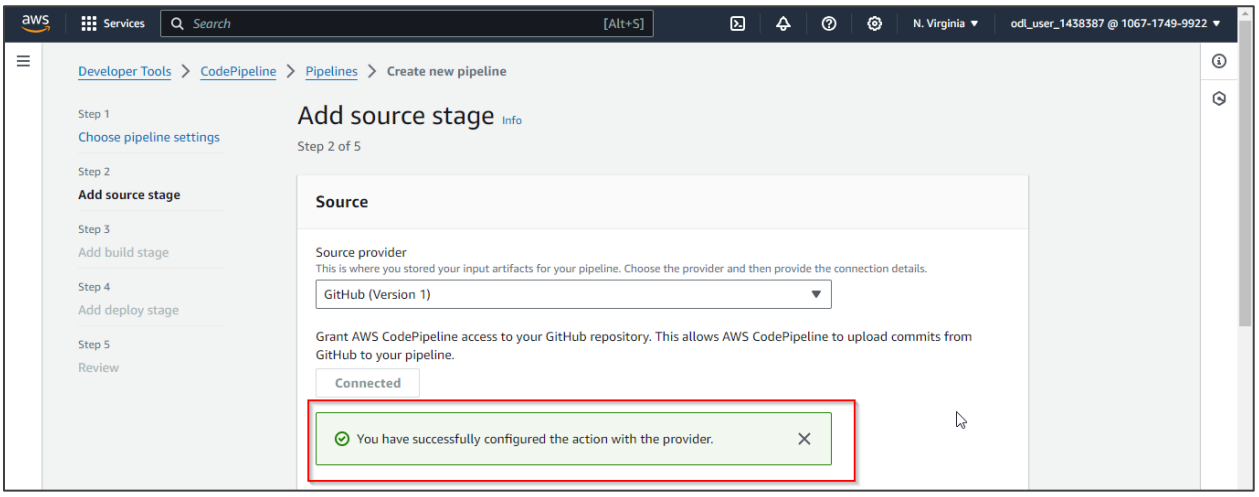
1.5 Select the desired **Source provider** as **GitHub (Version 1)**



1.6 Click on **Connect to GitHub**

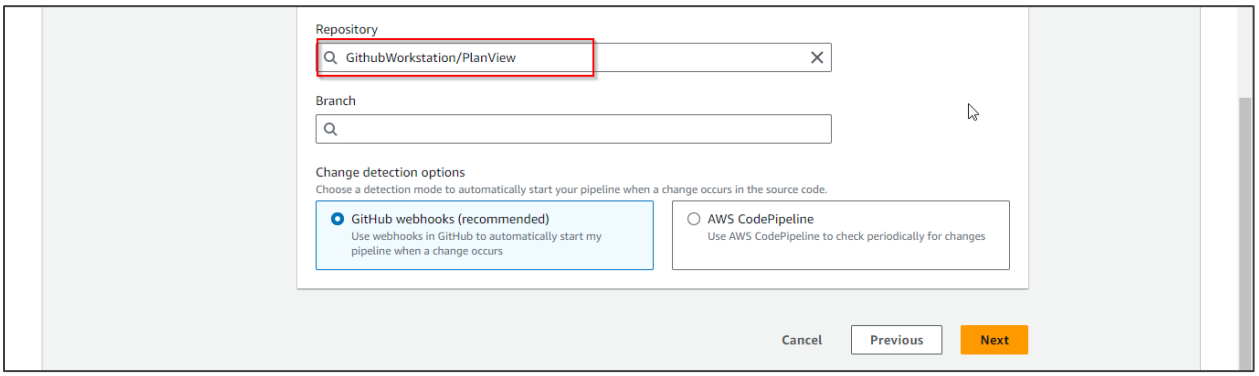


1.7 Click on **Confirm**



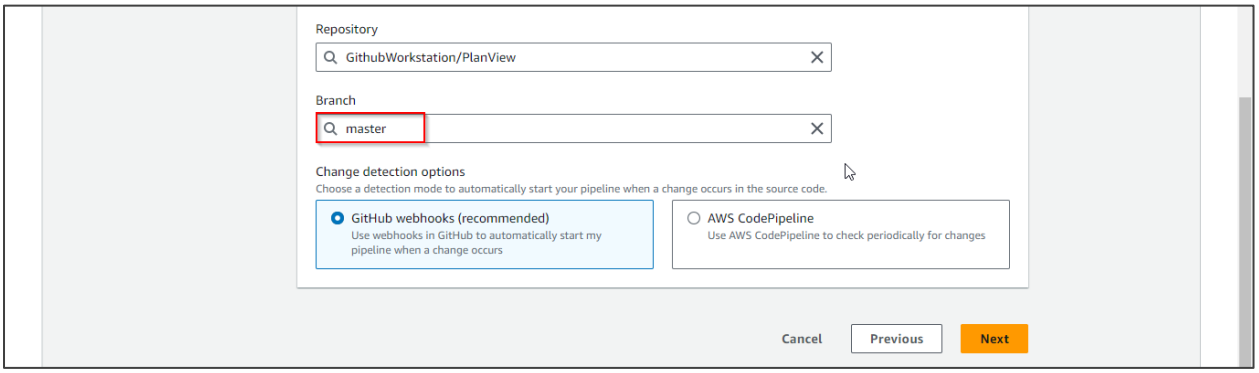
The GitHub connection is now ready for use.

1.8 Select the **GithubWorkstation/PlanView** option under **Repository**

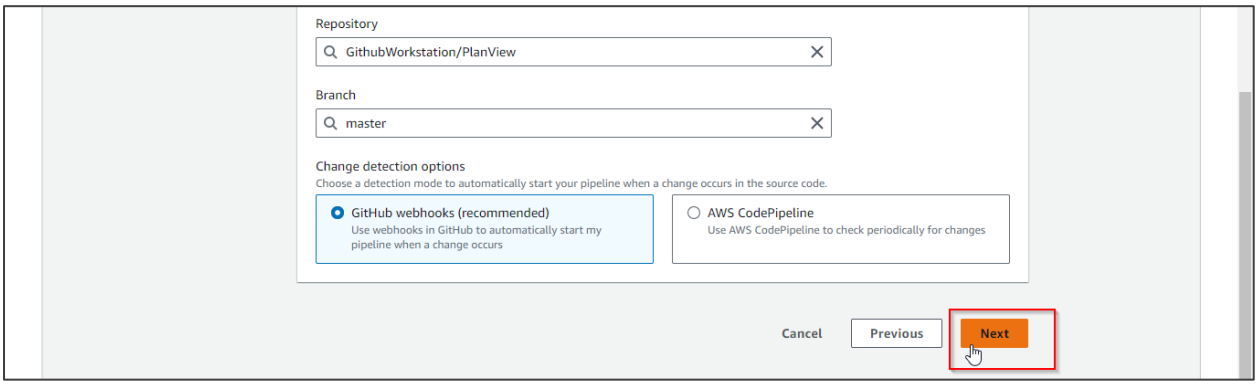


Note: Name the previously created repository as **PlanView** or specify any desired name of the repository you created

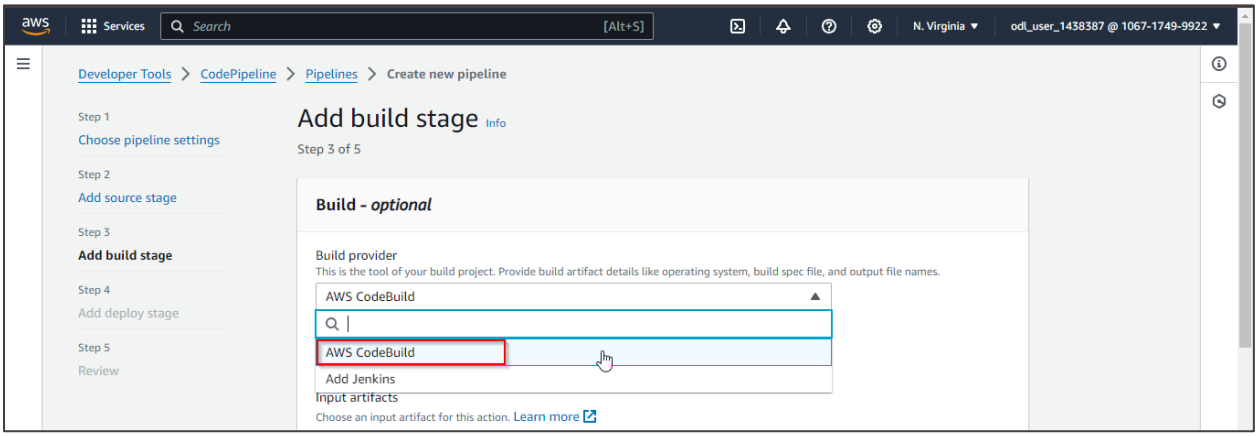
1.9 Select the **master** option under **Branch**



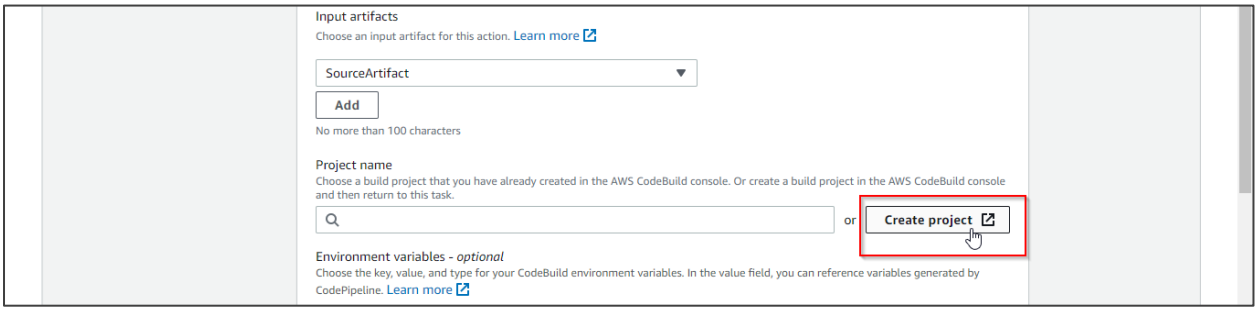
1.10 Click the **Next** button



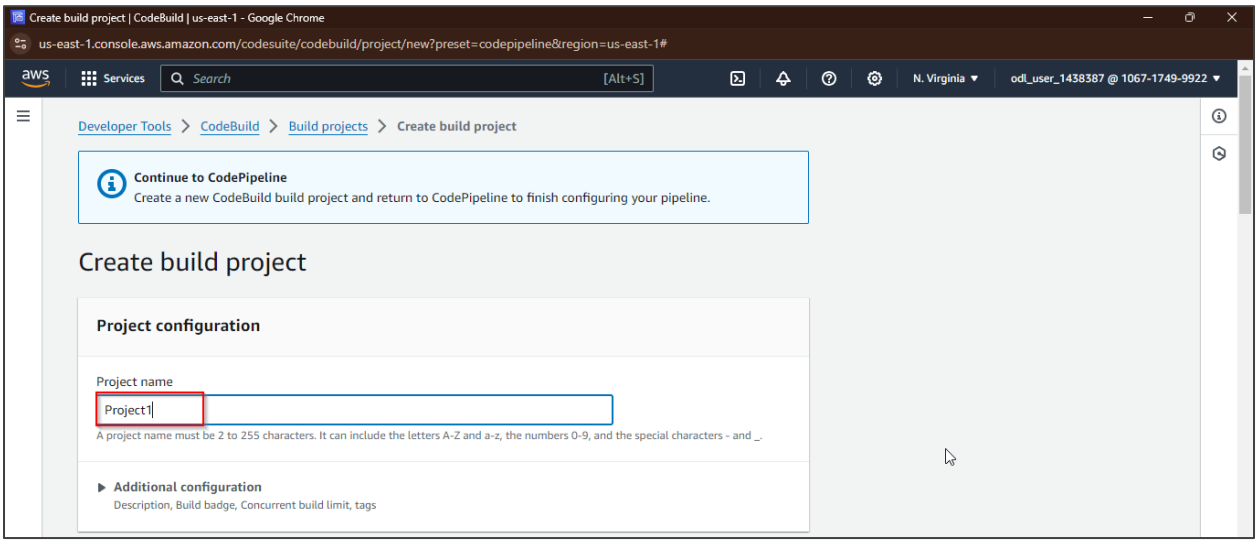
1.11 Select **AWS CodeBuild** under **Build provider** for building and automating tests



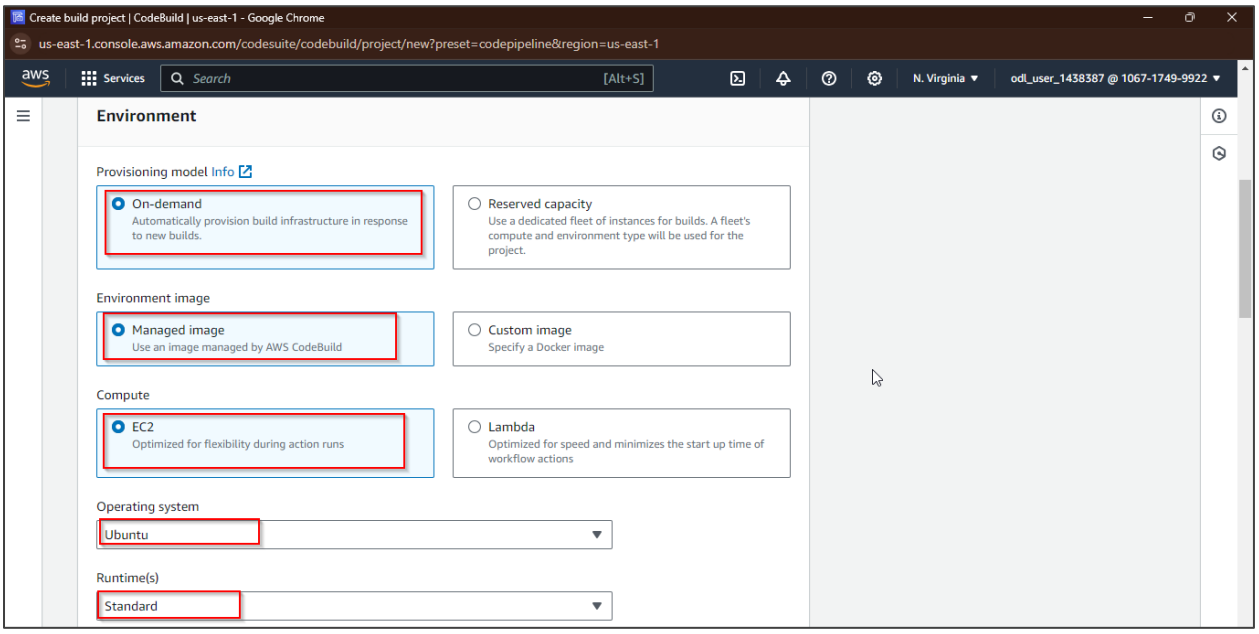
1.12 Click on the **Create project** button; a pop-up window will appear

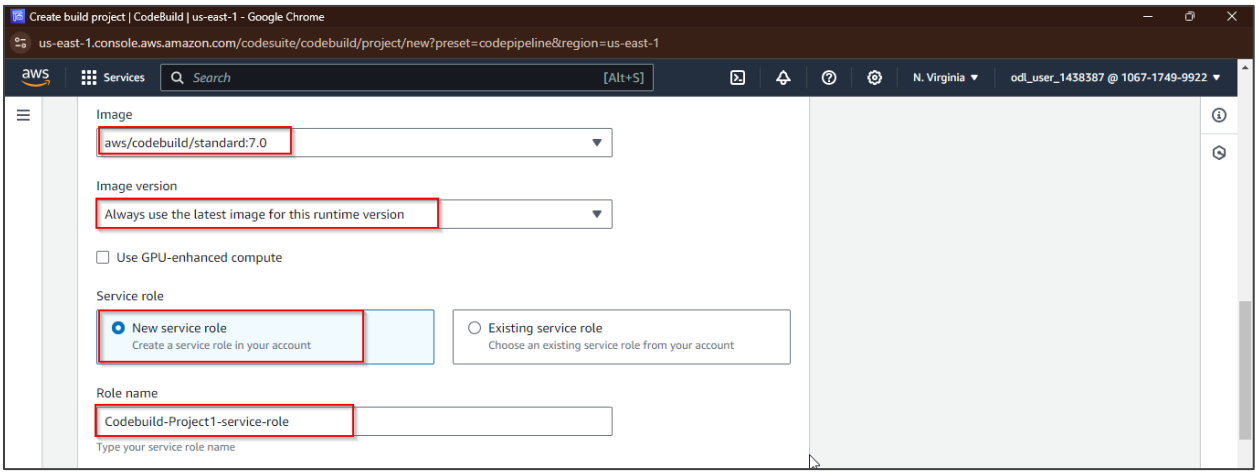


1.13 In the new window, add the name of the project

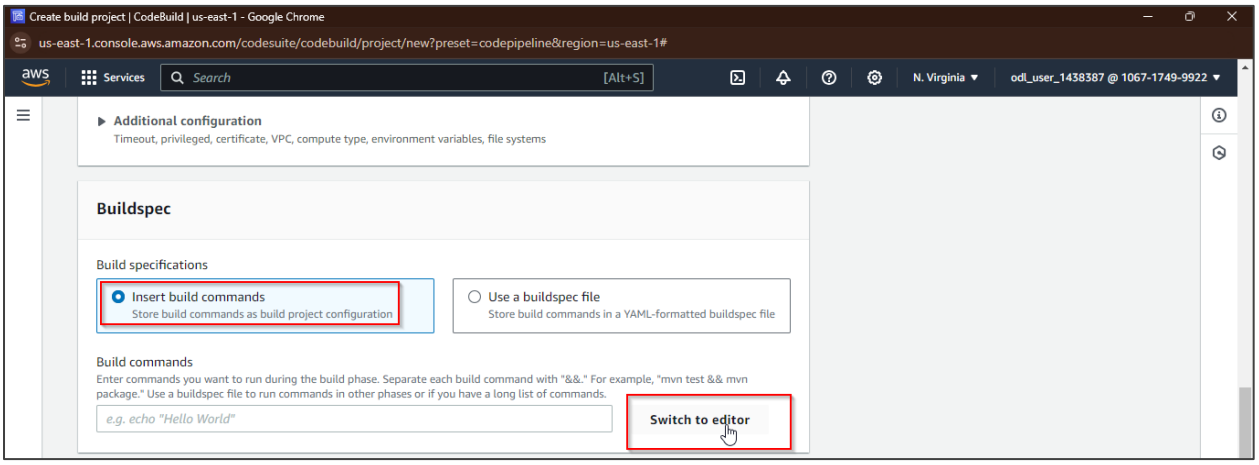


1.14 In the **Environment** section, add the details as shown in the screenshot below:





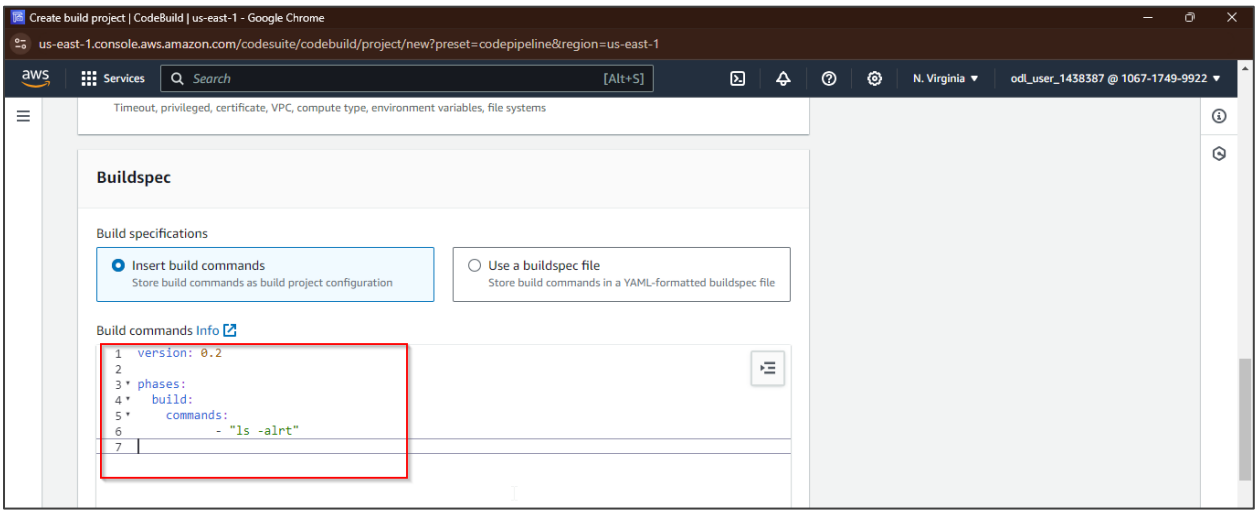
1.15 Under **Buildspec**, select the **Insert build commands** option and click on the **Switch to editor** button



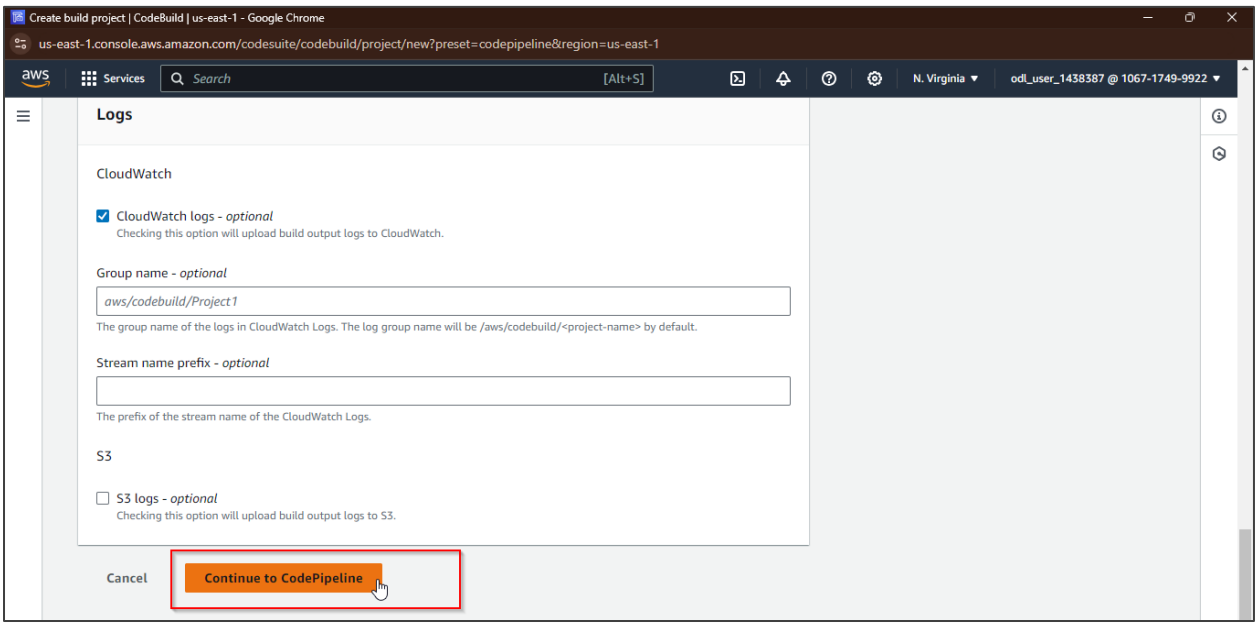
1.16 Remove the existing build commands from the editor and enter the following YAML code:

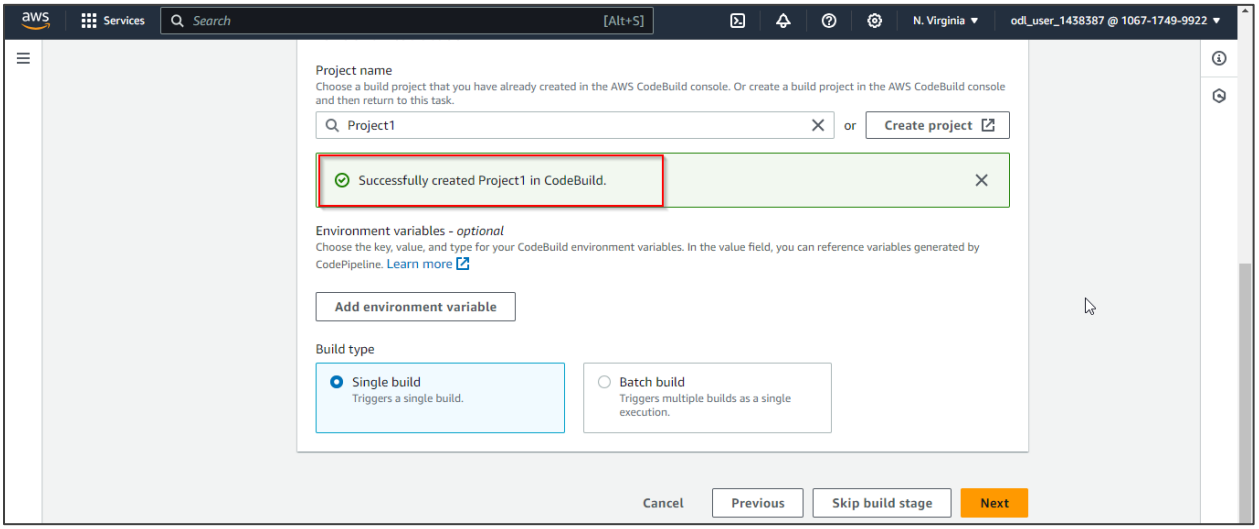
```
version: 0.2

phases:
  build:
    commands:
        - "ls -alrt"
```



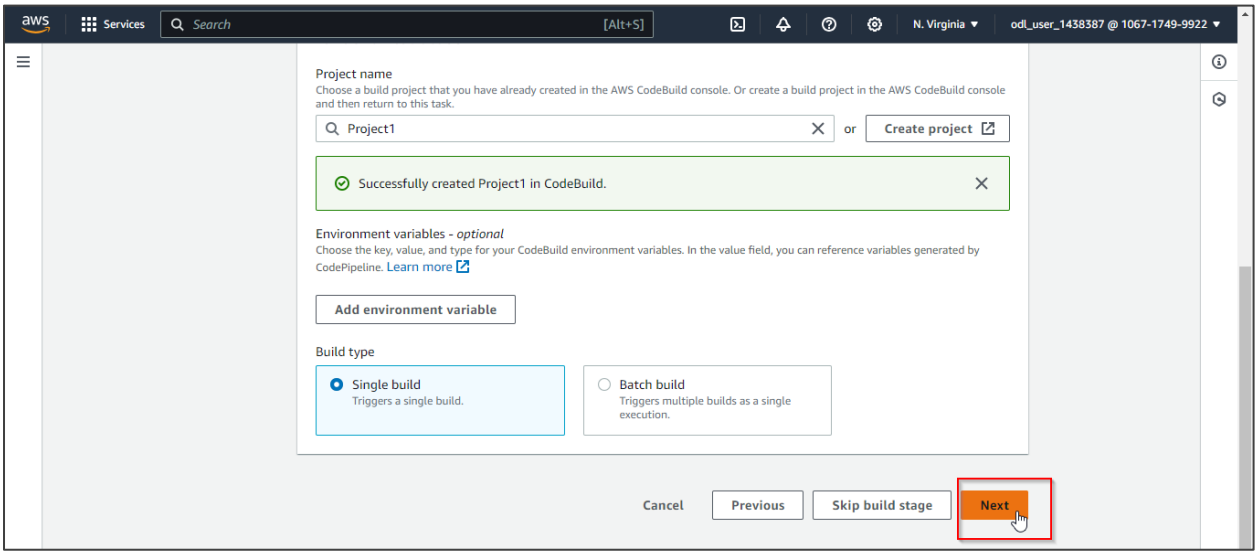
1.17 Scroll to the bottom of the page and click on the **Continue to CodePipeline** button



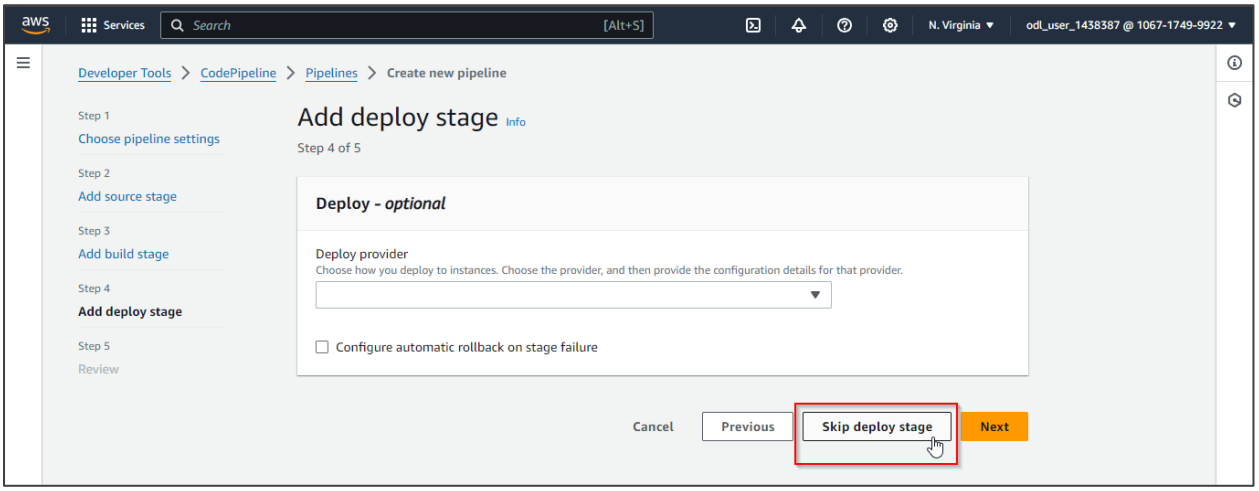


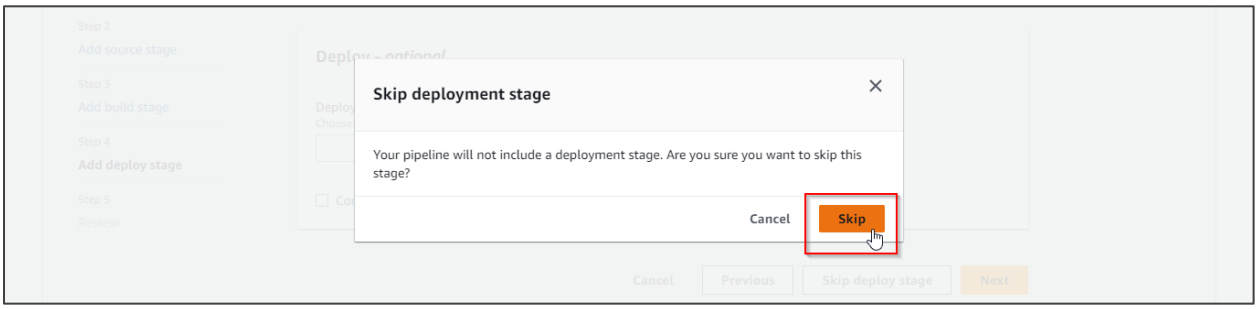
The project has been successfully created.

1.18 Now, click on the **Next** button

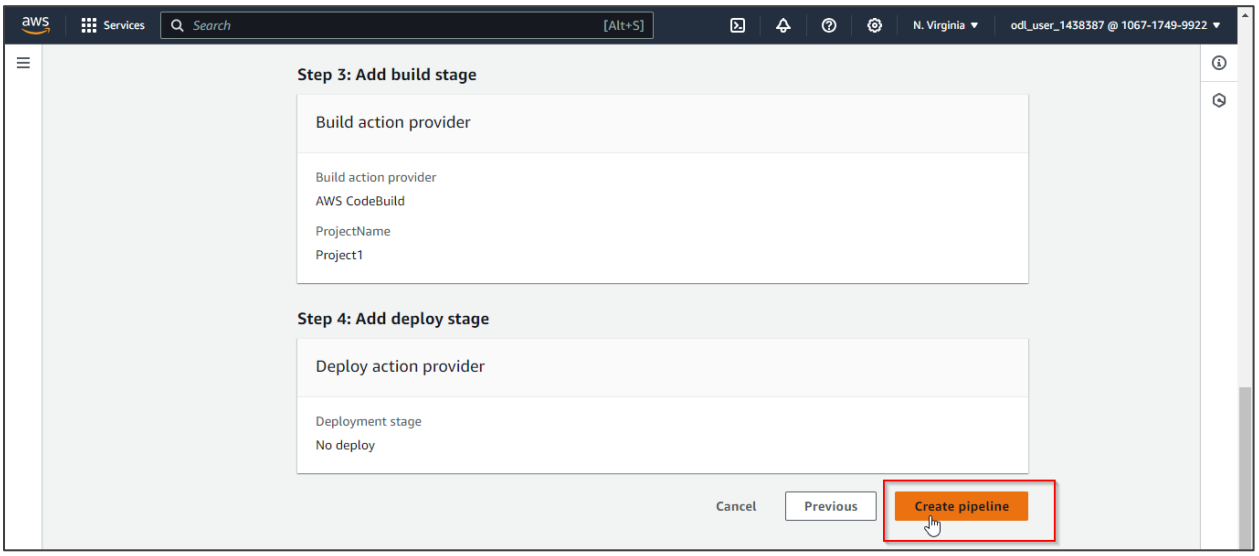


1.19 Click on the **Skip deploy stage** button and then on the **Skip** button to finalize the pipeline

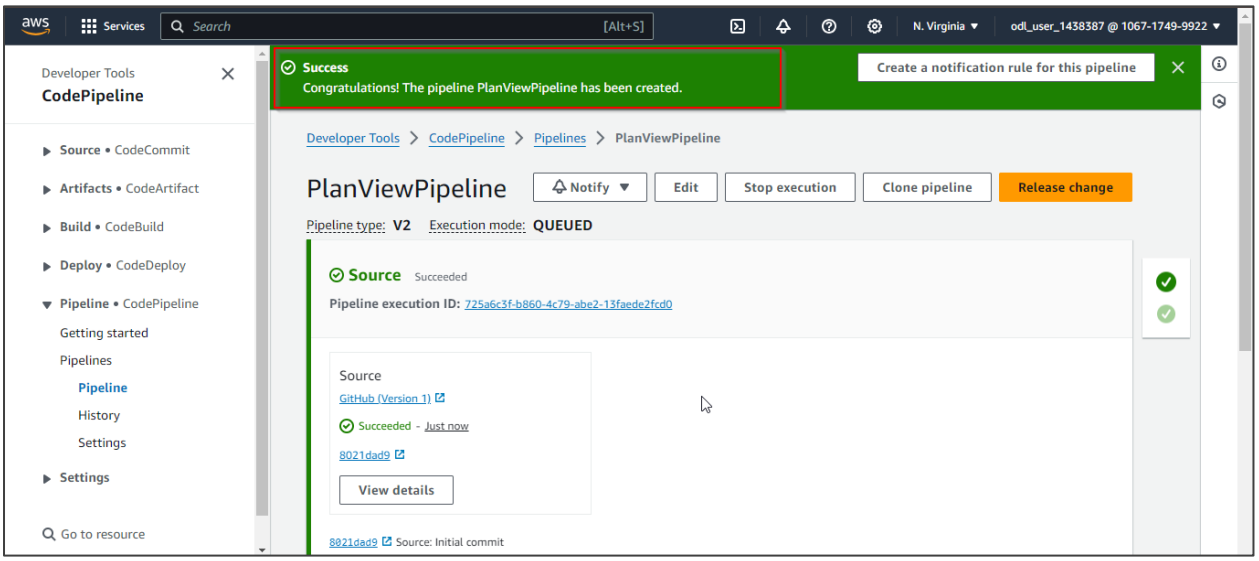


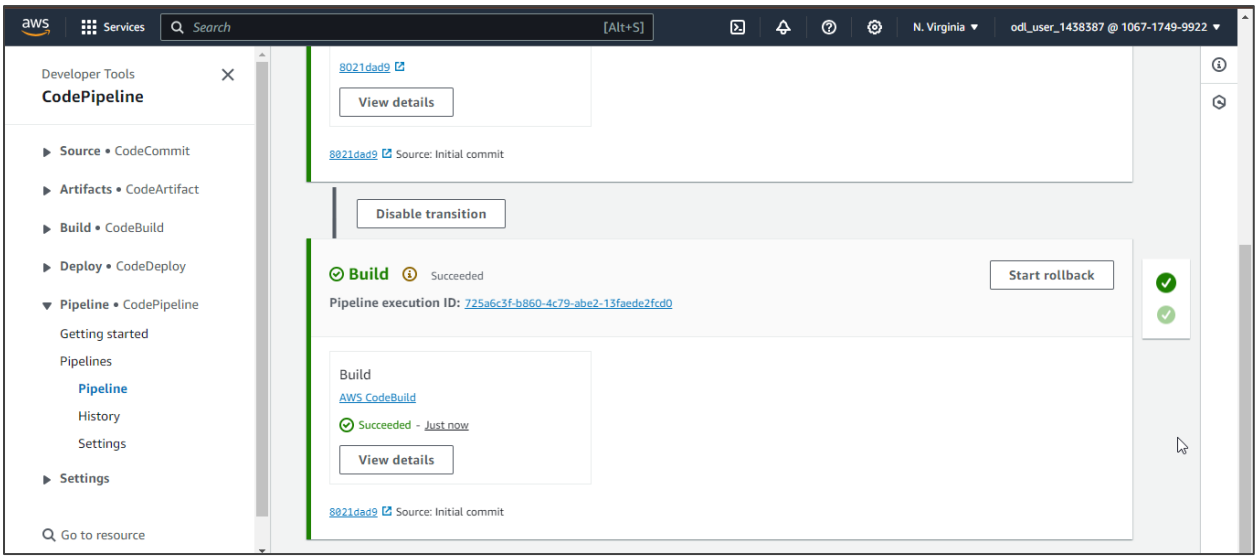


1.20 Scroll to the bottom of the page and click on the **Create pipeline** button

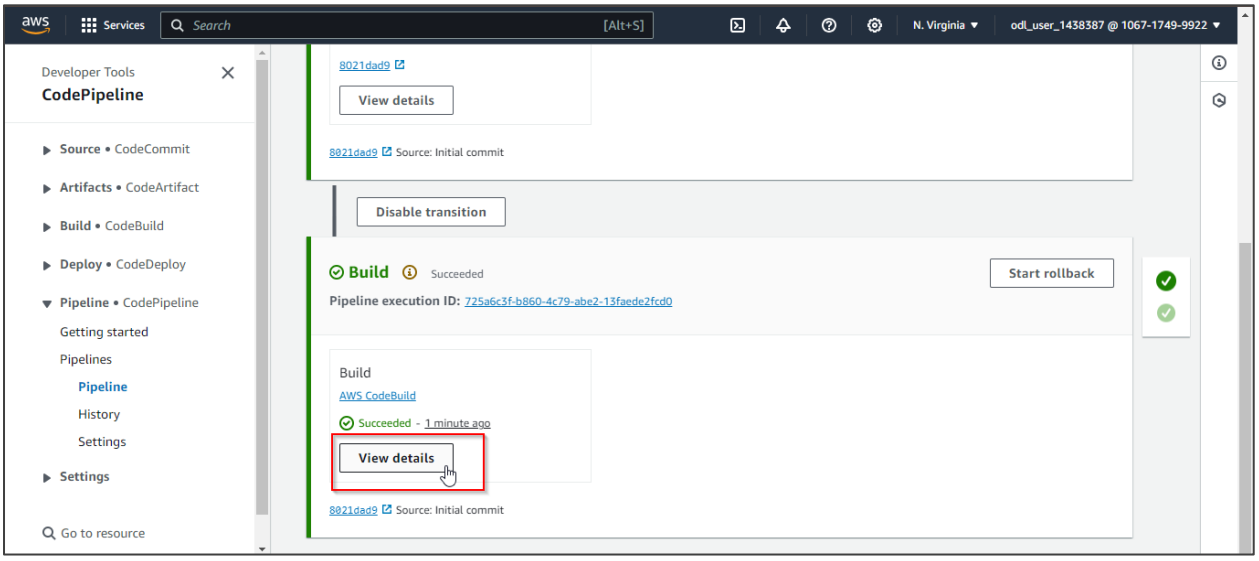


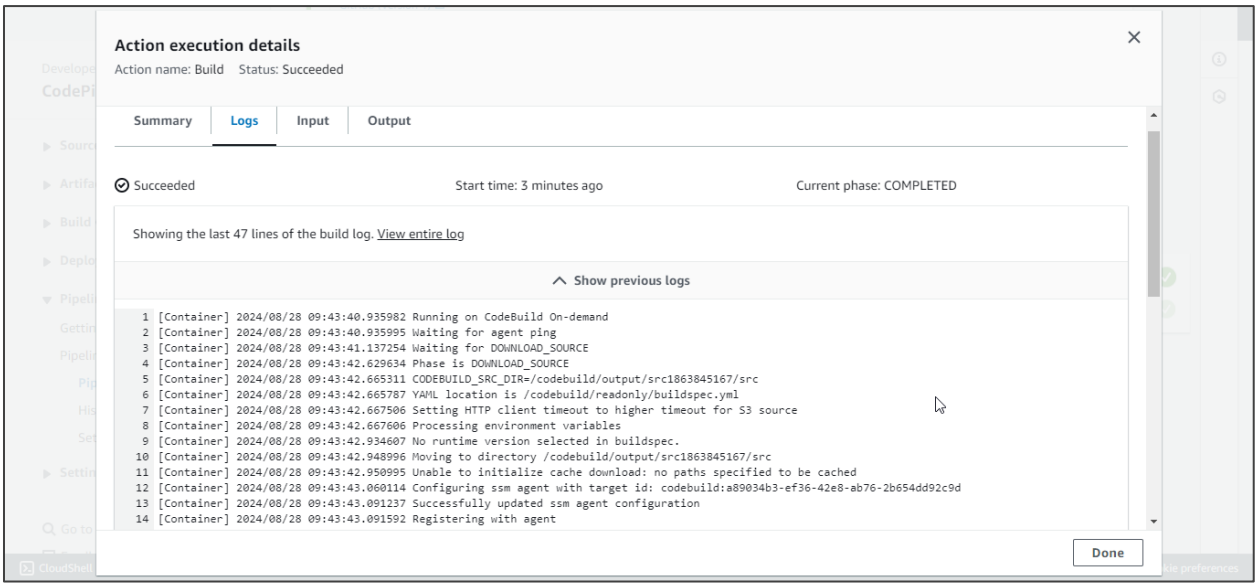
After creating the pipeline, the execution starts.





1.21 Once the build stage is completed, click on the **View details** button in the **Build** section for validation





By following these steps, you have successfully created an AWS CodePipeline for continuous integration and delivery (CI/CD) using a GitHub repository.
