

Lesson 11 Demo 03

Creating a Container Instance

Objective: To create a container instance to efficiently deploy and manage containerized applications

Tools required: Azure account with administrator access

Prerequisites: None

Steps to be followed:

1. Create a container instance

Step 1: Create a container instance

- 1.1 Log in to the Azure portal and click on **+ Create a resource**

1.2 Search for and select **Container Instances**

1.3 In the **Container Instances** page, click on **Create**

1.4 In the **Create container instance** page, navigate to **Basics** tab and enter the information as shown in the screenshots below:

Microsoft Azure Search resources, services, and docs (G+/)

Home > Marketplace > Container Instances >

Create container instance

Basics Networking Advanced Tags Review + create

Azure Container Instances (ACI) allows you to quickly and easily run containers on Azure without managing servers or having to learn new tools. ACI offers per-second billing to minimize the cost of running containers on the cloud.

1.5 In the **Networking** tab, specify a DNS name label for your container and click on **Review + create**

The screenshot shows the 'Create container instance' page in the Microsoft Azure portal, specifically the 'Networking' tab. The page has a blue header with the Microsoft Azure logo and a search bar. Below the header, there's a breadcrumb trail: Home > Marketplace > Container Instances >. The main heading is 'Create container instance' followed by three dots. Below this, there are tabs for 'Basics', 'Networking' (which is selected), 'Advanced', 'Tags', and 'Review + create'. A message states: 'Choose between three networking options for your container instance:'. This is followed by a bulleted list:

- **'Public'** will create a public IP address for your container instance.
- **'Private'** will allow you to choose a new or existing virtual network for your container instance.
- **'None'** will not create either a public IP or virtual network. You will still be able to access your container logs using the command line.

 Below the list, there's a 'Networking type' section with three radio buttons: 'Public' (selected), 'Private', and 'None'. Underneath, there's a 'DNS name label' field with the value 'newcontainerdemo' and a green checkmark icon. To its right is a 'DNS name label scope reuse' dropdown menu with 'Tenant' selected. Below these is a 'Ports' section with a table. The table has two columns: 'Ports' and 'Ports protocol'. The first row shows '80' in the 'Ports' column and 'TCP' in the 'Ports protocol' column. There are empty input fields below each of these values. At the bottom of the form, there are three buttons: 'Review + create' (in blue), '< Previous', and 'Next : Advanced >'.

Note:

The name must be distinct within the Azure region where you create the container instance, and your container will be accessible at <dns-name-label>.<region>.azurecontainer.io. If you encounter a *DNS name label not available* error, please select an alternative DNS name label.

1.6 After the validation passes, click on **Create**

The container instance gets deployed, and a message confirming the same will appear as shown in the screenshot below:

By following these steps, you have successfully deployed a container instance to efficiently deploy and manage containerized applications in the Azure cloud, ensuring seamless integration with specified image details and resource configurations.
